

CAIRO

Lolium multiflorum

Speed is what you need?

Profile

CAIRO brings speed into the life of a mixture. One of two listed annual ryegrasse on the national turfgrass list in Germany. The superior feature of Cairo is its fast germination also at low temperatures. CAIRO is very special as it can be used to improve the winter appearance of a sward. Easy to over seed in late autumn it solves the problem of unsightly worn out looking winter surfaces.
But also in the season if you are in need to fast green up bare spots, howl pitches or area parts e.g. goal mouth) CAIRO is the first aid kid as single use or in a well composed fast reaction mixture.

Ideal to use is CAIRO in early spring to speed up green appearance as it is a lot faster compared with perennial ryegrass. As we talk about first aid this is something for professionals who know that a fast solution needs a long
term follow up where tetraploid ryegrass in combination with some Poa pratensis are solid solutions.

- Low temperatures germination
- Fast establishment, especially in spring
- First-Aid-Kid, for the fast solution
