

TRIDENT
Fodder radish
(*Raphanus sativus*)

Three times excellent against
nematodes

TRIDENT is an excellent oil radish variety with three nematode resistances: *Heterodera schachtii*, *Meloidogyne chitwoodi* and *Meloidogyne hapla*. Therefore, TRIDENT is a good choice for nematode control in intensive crop rotations with sugar beets, potatoes and vegetables. The variety shows a fast development at the beginning, which leads to good weed suppression. Deep rooting and lower tendency for flowering are other good arguments for TRIDENT.

- ✓ Resistances: *Heterodera schachtii*, *Meloidogyne chitwoodi* and *hapla*
- ✓ Nematode control in intensive crop rotations with sugar beets, potatoes and vegetables
- ✓ Safe early growth for effective weed suppression

Agronomic features

Early growth development	6	Medium to strong
Tendency to flowering	3	Low
Tendency to lodging	2	Very low to low
Susceptibility to beet cyst nematodes	2	Very low to low

General usage

Cover crop and green manure

Nematode reduction

Cultivation

Sowing rate:
25 – 30 kg/ha

Sowing date:
Mid of July to end of August
